

Capability, competitor and license brief

A precise way to show what the working pilot demonstrates, how the market validates the operating pattern, and which enterprise capabilities remain approval or entitlement decisions.

BUILD FIRST WITH DETERMINISTIC EVIDENCE. CONNECT APPROVED SYSTEMS NEXT. BUY OR EXTEND ONLY WHERE MEASURED VALUE PROVES THE NEED.

THE ANSWER IN ONE MINUTE

What you can say—without overstating it.

SET Loop connects an established retail operating pattern—governed intake, localized direction, role-based execution, evidence, feedback, and reporting—using the tools and files already present in the workflow. Production access, enterprise automation, advanced AI, and savings remain explicit validation gates.

Leadership-safe points

- **The market pattern is established.** Retail platforms document localized planning, task execution, audits, proof, and reporting.
- **The pilot is working and bounded.** It demonstrates role views, intake, checklists, feedback, referral links, exports, and source-aware Q&A in the browser.
- **The differentiator is the connected thread.** SET Loop links upstream campaign/asset identity to field execution and learning.
- **Deterministic first; AI second.** Approved sources, exact IDs, visible exceptions, and accountable owners come before assistance.

Language to use

WORKING PILOT means the current experience performs the stated browser-local behavior.

VERIFY ENTITLEMENT means the vendor capability exists, while plan, permission, policy, environment, and support still require owner confirmation.

NOT ASSUMED means the capability is outside the current promise.

“Reuse-first” is the strategy.
“Already licensed” is not the claim.

WHAT HAS NOW BEEN BUILT

One thread from source intake to field learning.

01 · Partner intake

Owner, scope, date, approved source

02 · Promo + assets

Pack, sign, placement, exception gate

03 · Build + publish

Role-specific release and direction

04 · Execute

Tasks, readiness, placement checks

05 · Evidence

Photo, tally, question, reaction

06 · Learn

Patterns return to accountable owners

WORKING PILOT

Role views

Store, District, Region, and Home Office dashboards with scoped KPIs, tasks, readiness, navigation, and force refresh.

WORKING PILOT

Promo + marketing

Campaign intake, asset identity, store placement tally, missing-item selection, VMH-ready CSV, and checklist export.

WORKING PILOT

Interactive buy-in

Designed Outlook invitation, trackable landing page, reaction choices, interests, and optional participant context.

WORKING PILOT

Brand Guide + SET IRL

Same-window guide access, navigation to key sections, and field return-path framing.

WORKING PILOT

Guardrailed SET Agent

Approved-source answers, visible citations, no-web/no-guess behavior, and partner escalation.

PRODUCTION GATE

Central reporting

Cross-user data, identity, permissions, durable workflow, retention, and audit require approved tenant deployment.

NEW CONNECTED PROOF

From promotion direction to the exact VMH request.

Home Office / source owner

- Defines campaign, market, effective dates, store scope, and approved source.
- Normalizes pack, sign, placement, and quantity identity.
- Holds missing or conflicting data at a visible exception gate.
- Publishes only owner-approved direction.

Store / DM / RM

- Checks required signs against current on-hand and placement.
- Sees the current readiness tally and count needing action.
- Selects only missing items and downloads `ProductNumber, Quantity`.
- Opens authenticated VMH and uploads the reviewed CSV.

AI helps locate evidence; it does not create marketing truth.

The SET Agent can answer from the approved campaign manifest and Brand Guide, explain placement or quantity, and list missing items. If evidence is absent, it prepares a Marketing clarification instead of guessing.

4

Pilot marketing records in the working example

50%

Quantity-based example readiness before shortages are resolved

CSV

Exact VMH bulk handoff format

0

Orders auto-submitted; human review remains required

CAPABILITY-LEVEL COMPARISON

What the competitor set demonstrates.

First-party product pages establish vendor capability claims—not independent ROI, implementation fit, company entitlement, or feature parity.

Platform	Documented capability pattern	What it validates	SET Loop boundary
Blue Yonder	Floor Planning for macro-space and layouts; Space Planning for SKU/fixture planograms; Planogram Generator for rules-based store-specific generation.	Localized, data-informed planning at scale.	Specialized planning—not evidence of SET Loop optimization, batch generation, APIs, or licensed access.
RELEX	Floor planning, store-specific planograms, space optimization, and store-execution workflows.	Central planning connected to localized execution.	Market analogue only; no company entitlement or feature-parity claim.
Zebra Workcloud	Frontline task workflow, communication, prioritization, execution, and operational visibility.	The downstream task-distribution layer.	No Zebra entitlement, integration, or deployment claim.
YOOBIC	Task coordination, digital checklists, audits, photo verification, offline completion, visual-merchandising feedback, and tracking.	The store-facing task, proof, feedback, and visibility layer.	No automated scoring, integration, rollout, or company entitlement claim.

SET Loop does not need to claim it “does everything.” Its defensible position is the connective operating layer: structured intake and source lineage upstream; role-specific action, proof, feedback, and escalation downstream.

NO POWER BI REQUIRED FOR THE PILOT

Start with assigned services—not the plan label.

Audience / capability	Practical pilot path	What it supports	Confirmation gate
Public/static pilot	BROWSER ONLY	HTML role views, local interactions, local exports, and the current demonstration.	Public hosting is not appropriate for sensitive production data.
Read-mostly field users	ASSIGNED-PLAN CHECK	SharePoint may support approved pages and content when the user has the service.	F1/F3/E3 labels alone are insufficient: confirm the assigned SharePoint service plan, device access, and permissions.
Active store contributors	SCENARIO CHECK	SharePoint lists plus Microsoft 365-seeded Power Apps/Automate rights may support standard-connector scenarios.	Confirm connectors, environment, DLP, security model, sharing, and every create/edit action.
Home Office owners	OWNER CHECK	Authoring and workflow ownership where assigned services and maker rights permit it.	Confirm plan, admin/maker rights, run owner, support model, retention, and capacity.
Dashboards	NO POWER BI NEEDED	HTML KPI cards, SharePoint Lists, list views, Excel for web charts, CSV/JSON exports.	Power BI remains optional if governed enterprise analytics later justify it.

Recommended pilot architecture

SharePoint Lists for tasks, readiness, reactions, evidence, and intake; existing HTML or approved SharePoint components for views; standard Power Automate connectors for routing; Excel web charts where needed.

Important: Premium/custom connectors, broader Dataverse use, Managed Environments, RPA, Power BI distribution, Copilot, and agents can introduce separate user or capacity requirements.

MICROSOFT, ADOBE + CONNECTED SOURCES

Confirm access before promising production.

Capability	Status	Supported role	Confirmation gate
SharePoint	VERIFY	Files, lists, metadata, permissions, versioning, collaboration.	Assigned plan, site ownership, information architecture, retention, store/device access.
Power Automate + SharePoint	VERIFY	Triggers, list/file actions, notifications, approvals.	Environment, connector class, DLP, maker rights, run owner/service account.
Power Apps + SharePoint	VERIFY	Custom forms, apps, and mobile capture.	Seeded versus premium rights, accessibility, devices, sharing, support.
Adobe InDesign + Photoshop	EVIDENCED	Page layout, image editing, and script-assisted handoff.	Version, seat, script/plugin policy, deployment, approved storage, support owner.
Creative Cloud Libraries	VERIFY	Reusable colors, styles, and graphics across Creative Cloud applications.	Teams/enterprise plan, company ownership, sharing model, and storage policy.
Adobe Asset Link + AEM	NOT ASSUMED	Search, metadata, placement, upload, and asset version workflows inside Creative Cloud.	AEM entitlement, supported versions, identity, permissions, plugin deployment, and support.
Blue Yonder-derived data	EVIDENCED	Read-only dated structural inputs in the supplied workflow.	Authoritative extract, definitions, permitted reuse, export/API/module rights.
Power BI	OPTIONAL	Enterprise dashboards if the business later needs them.	Author/viewer licenses, workspace, capacity, governance.
M365 Copilot / Copilot Studio / AI Builder	NOT ASSUMED	Potential governed retrieval, agents, and models.	Separate SKU/capacity, permissions, environment, DLP, security, support.

Correct phrase: “The capability exists in the vendor stack; IT and the product owner must confirm our exact entitlement, policy, data boundary, and deployment route.”

GROUNDED ASSISTANCE

Useful because it knows when not to answer.

Approved sources only.

Brand Guides, accepted promotion manifests, connected partner records, and role-permitted operational data.

The SET Agent may

- Locate approved direction and cite the source.
- Explain a placement, pack, task, or readiness record already present.
- Sort and summarize role-permitted information.
- Ask the user to refine an ambiguous question.
- Prepare an escalation with context and the accountable partner copied.

The SET Agent may not

- Search the public web for operational answers.
- Invent placement, quantity, offer, tier, inventory, timing, or approval.
- Treat a visual similarity as approved store applicability.
- Expose content the user is not permitted to access.
- Submit an order, approve a release, or change a source system without an authorized human action.

PRODUCTION GATE

Governance required

Identity, permissions, retrieval scope, citations, logging, prompt-injection controls, data-loss prevention, evaluation, human approval, and support ownership.

WHAT STAYS OUTSIDE THE PITCH

Boundaries make the story stronger.

Do not claim

- Confirmed license savings, zero incremental cost, or universal access.
- Feature parity with Blue Yonder, RELEX, Zebra, YOOBIC, or any other platform.
- Automatic image recognition, photo scoring, digital twins, optimization, or live inventory.
- Production SharePoint, Power Apps, Power Automate, AEM, UXP, or AI deployment before approval.
- Central tracking from the public/browser-local prototype.
- Automatic VMH upload or order placement.

Leadership decision frame

Build first

Deterministic intake, metadata, role views, checklists, source lineage, exports, feedback, and QA.

Connect next

Approved SharePoint, promotion, asset, Blue Yonder, time, capacity, inventory, and identity sources.

Buy or extend when justified

Computer vision, digital-store modeling, optimization, enterprise frontline execution, or governed agents.

Next decision: approve a bounded pilot and assign the owners who can validate data, access, licensing, security, and measurable success.

Evidence standard

Vendor pages support capability-level statements. They do not independently validate ROI, implementation effort, company entitlement, data readiness, security approval, or operational performance.
